Scaling Physical AI Through Robot Foundation Models

Where Should Robots Fail?

Everyone learns through failure. So do robots.
But the real world is an **expensive classroom**.

Every mistake costs:
Time, Money, and sometimes Hardware.

Robots need a place to:

- ✓ Fail safely
- ✓ Learn faster
- ✓ Train at scale

And that place needs to be almost indistinguishable from Reality.

That's exactly why we built **Real 3D Gym**.

Real 3D GYM

Robot-Ready Worlds for Physical AI

We turn real spaces into robot-ready simulation worlds.
Not for visualization. But for robot learning.

Our indoor reconstruction pipeline generates :

- High-fidelity geometry
- Accurate collision meshes
- Reliable simulation and policy training

Works even in challenging environments :

- White walls
- Long corridors
- Feature-sparse offices

✓ Reduce field testing ✓ Accelerate development ✓ Improve sim-to-real transfer

Geometry-only mesh

Colored mesh

The WORLD Is NOT 2D

Most robots today are trained for a single task.
That is specialization – **not intelligence**.

The Challenge

Today's AI understands:

Images, Text, Language

Robots operate in:

Space, Physics, Interaction

Robots don't live in screens. To scale robot intelligence,
Robot needs to understand the world humans live in.

Our goal is simple:

A World where robots act on a single word

Now

Real 3D Gym

Robot-Ready
simulation worlds built
from real spaces

Mid-term Goal

3D World Model

Spatial Intelligence
for the physical
world

Long-term Goal

Foundation
Model

General Intelligence
that can understand,
plan, and act
